If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 139 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Allowable Subject Matter

5. Claims 1-19, 21-24 are allowed.

The following is an examiner's statement of reasons for allowance:

While Keijser teaches a method, device, program, for optimizing measurement and control of the flatness of a strip of rolled material (whole document; Col. 4, lines 49-61), comprising: module for fusion or morphing a strip visualization with measured information (Fig., any phi function and feedback from flatness curve; OR, Fig. 1, any phi function and Col. 5, lines 31-41, stress distribution phi obtained by measurement), module for creating a set (a set can be one or more) of reference strip models for known flatness fault types (Fig., flatness error f referenced in evaluation 3; Col. 5, lines 19-30, f1, f2...fn; see also par. 47 of the instant specification).

And, Watanabe teaches module for visualizing the strip, and module for determining a relevant flatness fault type by comparing the visualization to a reference

Art Unit: 2121

strip model (Fig. 4, sheet crown or flatness % compared with target value line or allowable bounds lines or any line).

And, U.S. Pat. No. 5,727,127 to Schulze Horn et al teaches a camera s used to control cracks in the cast strip, wherein a model combines the thickness profile of the formed strip, the strip thickness, a possibly emerging error image, the grain structure of the strip, and the surface structure.

And, U.S. Pat. No. 4,700,312 to Kikuma et al teaches a camera detects positional displacement, curvature or snake motion of a strip, and feeds back a detection signal to a control unit to differentiate the signal for control of snake motion.

Referring to claims 1, 14, 19, none of Keijser, Watanabe, Schulze Horn, or Kikuma, taken either alone or in obvious combination disclose method, device, program, for optimizing measurement and control of the flatness of a strip of rolled material having all the claimed features of applicant's instant invention, specifically including: determining a relevant flatness fault type by comparing the visual image to one or more reference strip models for known flatness fault types, fusion or morphing the measured flatness with the determined relevant flatness fault type, and controlling flatness by comparing the fused or morphed measured flatness with a target flatness profile to determine a flatness error.

It is for these reasons that applicant's invention defines over the prior art of record. Claims 2-13, 15-18, 21-24, depend from claims 1, 14, or 19 and are therefore also allowable. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should

preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
